On what basis FieldNote recommends.

A recommendation is only worth trusting if you can see how it was reached. Every card is scored on four axes, then mapped to an action by a fixed rule. Nothing rests on opinion or a vendor's press release.

1 · Evidence grade — how well substantiated

A	Independent production evidence — named organisation, method, measurable result. Language: "observed in production".
B	Named customer case study or credible research with clear methodology. Language: "reported / associated with".
C	Vendor documentation, release notes or sponsored study. Language: "vendor states".
D	Demo, announcement or unverified secondary report. Language: "early signal, not verified".

2 · Verified outcome — what actually happened

The vendor's claim is checked against outcomes FieldNote has tracked across real pilots. The gap between claim and verified reality is itself the intelligence — and the proprietary asset a summary can't reproduce.

3 · Fit to your business

Does it address a stated priority, and are the conditions where it works present at your company? A strong average outcome with poor fit is still the wrong bet.

4 · Complexity & risk

Implementation effort, downside exposure and reversibility.

The decision rule

ADOPT	Strong evidence (A/B) + consistent positive verified outcome + good fit + low downside.
PILOT	Positive but variable outcome, or strong fit on a high-effort response — prove it in your context against a control before rollout.
INVESTIGATE	Real potential on vendor-grade (C) evidence — get methodology and references, then a small controlled test.
WATCH	Weak evidence or a negative track record — do not act; the downside outweighs the upside.

Note: pilot counts and verified figures in this sample dossier are illustrative. In production they are drawn from FieldNote's tracked-outcomes ledger, which accrues with every customer pilot.

PEER CASE STUDY · 16 SEP 2026

Churn-prediction model cuts subscription cancellations

Recommend: Pilot **Evidence B** Subscriptions Revenue

Why Pilot: Grade-B peer evidence, a clear measurable outcome (−14% churn across 12 publishers) and strong fit → pilot on your top-risk decile with a holdout so the result is bankable.

CLAIM → VERIFIED

~~Peer case study: "−30% churn"~~ → **−14% median across 12 tracked subscription publishers**

WHAT HAPPENED	Predicts at-risk subscribers and triggers retention offers; a named peer reports lower churn.
TRACK RECORD	Meaningful for publishers with enough subscribers to model; below ~20k subs the signal is drowned in noise. Best fit: above ~20k paying subscribers.
COMPANY RELEVANCE	High given a paid subscription with meaningful monthly churn.
REQUIREMENTS	Subscription event data · offer engine · holdout group.
KEY RISKS	Offer cannibalization · data quality · privacy.
SUCCESS MEASURES	Churn · save-rate · LTV · offer margin — vs holdout.
EVIDENCE & SOURCES	Named peer case study with shared methodology.

RECOMMENDED NEXT STEP

Score subscribers weekly, trigger save-offers to the top-risk decile only, hold out a control, and read churn and offer-margin after one cycle.
